

CP414: Foundations of Computing

BY SCOTT KING

Winter Term 2017

Office: N2087

- For reference, a *problem* is a general problem (ex. travelling salesman) and a *problem instance*, is a specific case of a problem
- There are times where we can solve complimentary problems given the solution to another problem (ex. determining if a graph is 2-colourable can be solved by checking if the graph is bipartite; which can be done with BFS)
